"Genome sequence of Vibrio parahaemolyticus: a pathogenic mechanism

I distinct from that of V. cholerae.";

Lancet 361:743-749(2003).

C -1- FUNCTION: Bidirectionally degrades single-stranded DNA into large

acid-insoluble oligonucleotides, which are then degraded further

into small acid-soluble oligonucleotides (By similarity).

C -1- CATALYTIC ACTIVITY: Exonucleolytic cleavage in either 5'- to 3'-

C -1- SIRRINIT. Hetersoligonucleoside 5'-phosphates.

                                                                                                                                                                                                                                                                                                                                                                                                       the vertebrate eye lens (By similarity).

C -| DOMAIN: Has a two-domain beta-structure, folded into four very similar greek key motifs (By similarity).

C -|- SIMILARITY: Belongs to the beta/gamma-crystallin family.

04-APR-1997;
The sequence is that of a protein which can be used in the preparation of the recombinant breast cancer antigen, BRCA1, binding proteins BARD1, B123, BE2, BE14 BE31 or BE445, or a composition for the detection of a BARD1, B123, BE2, BE14, BE31 or BE445 nucleic acid sequence, specifically a wild type BARD1 composition for the detection or purification of BRCA1, useful to identify a patient having, or at risk of developing cancer. BARD1 can be used in the preparation of an anti-BARD1 antibody, and in the detection and purification of a BRCA1 protein. BARD1, B123, BE2, BE14, BE31 or BE445 can used in the identification of a binding protein agonist or antagonist that alters the binding of BARD1, B123, BE2, BE14, BE31 or BE445 to BRCA1 or the biological activity of the BRCA1-BARD1,
                                                                                                                                                                                             DNA sequence encoding BARD1, B123, BE2, BE14, BE31 or BE445 - breast cancer antigen, BRCA1, binding proteins are useful to i patient having or at risk of developing cancer.
                                                                                                                                                                                                                                                     WPI; 1998-230317/20.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                        The invention is directed to BAP28 polypeptides, BAP28 polynucleotide sequences and regulatory region located at the 3' and 5' ends of the BAP28 coding region. The BAP28 polypeptides can be expressed by standard recombinant methodology. BAP28 polynucleotides and polypeptides have been found to be over expressed in prostate tumour cells, therefore levels of BAP28 expression and/or activity may be assayed (e.g. by polymerase chain reaction (PCR)) to diagnose patient suffering from or susceptible to prostate cancer. Antibodies specific for the BAP28 polypeptides are useful as diagnostic reagents. Biallelic markers of the BAP28 gene are useful as diagnostic reagents. Biallelic markers of the BAP28 gene are useful as diagnostic reagents. Biallelic markers of the BAP28 gene are useful as diagnostic analysis. The present sequence represents a protein encoded by a first cDNA sequence of the BAP28 gene consisting of the exons 1 to 45
                                                                                                                                                                                                                                                           New BAP28 polynucleotides and polypeptides overexpressed in prostate cancer cells for diagnosing prostate tumors, e.g. by hybridization oppolymerase chain reaction assays.

                                                                                                                                                                                                                                                                                                                                                                                                                    CC AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic CC activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynuclectides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to Supplement the patients own production of (I). Additionally, (I) CC polynucleotides may be used to produce the secreted (I), by inserting the CC nucleic acids into a host cell and culturing the cell to express the CC protein. (I) proteins and polynucleotides may be used to prevent, CC cancers and cancer metastases of haematopoietic-related diseases, especially CC cancers and cancer metastases of haematopoietic antigen genomic CC sequences from the present invention. AAK54950 and AAM82169 CC represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cc activity, and can be used in gene therapy and vaccine production. (I) cyroteins and polynucleotides may be used in the prevention, diagnosis and creatment of diseases associated with inappropriate (I) expression. For ce example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome cthat affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) concerts and be used to produce the secreted (I), by inserting the cc nucleic acids into a host cell and culturing the cell to express the crotein. (I) proteins and polynucleotides may be used to prevent, concerts and treat immune/haematopoietic-derived cells. AAK64703 cc cancers and cancer metastases of haematopoietic-derived cells. AAK64703 cc sequences from the present invention. AAK54942 to AAK54950 and AAM82169 cropresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil-associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.
                                                                                                                                                                                                                                                             (LAUR/)

or down-regulated in transgenic plants overexpressing the heterodimeric E2Fa/DPa transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes generating transgenic plants for the production of growth regulators, enzymes, therapeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or biomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, biochemistry, signal transduction, storage lipid mobilisation and/or altered photosynthesis,
                                                                                                                                  This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up or down-regulated in transgenic plants overexpressing the heterodimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         plant; transgenic; E2Fa/DPa transcription factor; growth regulator; animal feed product; thale cress; cell wall biosynthesis; nitrogen metabolism; carbon metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genom the construct, that is functional in the plant to transcribe the oil-associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid
                                                                                                                                                                                                                                                  Altering plant characteristics, useful for producing plants for enzyme or pharmaceutical production comprises modifying in a plant, expression of one or more nucleic acids and/or modifying level or activity of one or
                                                                                                                                                                                                                                          more

                                                       The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequences can also be useful as positive or negative selectable markers during transformation of cells or tissues. The identified genes play a role in a variety of biological processes such as DNA replication, cell wall biosynthesis, nitrogen and/or carbon metabolism or they function as transcription factors. This polypeptide sequence is thale cress protein expressed by a gene upregulated 1.3 fold or more in plants overtexpressing the E2Fa/DPa transcription factor, given in an exemplification of the
response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful fundanceombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicide antibacterials
                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                     WPI; 2003-148459/14
